

STM32CubeProgrammer + Atollic TrueSTUDIO for STM32

Integrating STM32CubeProgrammer

What - why - how

What is STM32CubeProgrammer?

Why integrate it?

How can the tool be integrated?

What is STM32CubeProgrammer?

STM32CubeProgrammer (STM32CUBEPROG) is an all-in-one multi-OS software tool for programming STM32 microcontrollers.

Pre-requisite – download STM32CubeProgrammer here:

<http://www.st.com/en/development-tools/stm32cubeprog.html>

This provides an environment for reading, writing and verifying device memory through both the debug interface (JTAG and SWD) and the bootloader interface (UART and USB).

STM32CubeProgrammer is delivered in GUI (graphical user interface) and CLI (command-line interface) versions.

This app-note will describe **how to invoke the CLI version from inside Atollic TrueSTUDIO** (or any other Eclipse based tool).

Why/when integrate STM32CubeProgrammer?

Do you really need to integrate STM32CubeProgrammer into Atollic TrueSTUDIO? Most likely the answer is "No".

BUT STM32CubeProgrammer offers more functionality compared to the Atollic TrueSTUDIO ST-Link GDB-server which manage the programming of STM32.

Integrating STM32CubeProgrammer into TrueSTUDIO can boost your efficiency compared to using ST-Link GDB-server. Here are some use cases:

- STM32CubeProgrammer supports flashing of STM32 devices not yet supported by ST-Link GDB-server
- STM32CubeProgrammer flash operation sometimes faster than ST-Link GDB-server
- Option bytes must be set/cleared pre/post flash operation
- Flash download must be handled using UART/USB (bootloader)
- STM32CubeProgrammer can program external memories in STM32 eval/disco boards

How-to integrate STM32CubeProgrammer?

Atollic TrueSTUDIO (Eclipse) supports setting up *external tools configurations*

External tool configurations can be chained into a *Launch Group*

In this document STM32CubeProgrammer will be setup as an *external tool*. This tool will be chained into a *Launch Group* together with your ST-Link debug configuration so that each time the *Launch Group* is run the following happens:

1. STM32CubeProgrammer is launched to carry out programming related operations. Then disconnects from the ST-Link and exits.
2. A debug session is launched using the ST-Link GDB-server. The debug configuration skips the programming operation (load).

The external tools configuration allows the user to setup multiple configurations using different STM32CubeProgrammer commands.

How-to

This chapter describes how-to setup the integration in Atollic TrueSTUDIO (Eclipse)

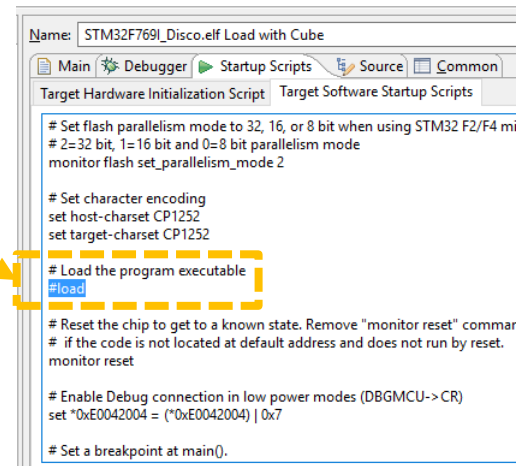

First duplicate the debug configuration (optional)

Do this for back-up purpose or in case you want to be able to chain up different launch use cases and need one debug configuration for each use case:

1. Run → Debug Configurations...
2. Right-click on your Embedded debug configuration → Duplicate
3. Give the copy a new name

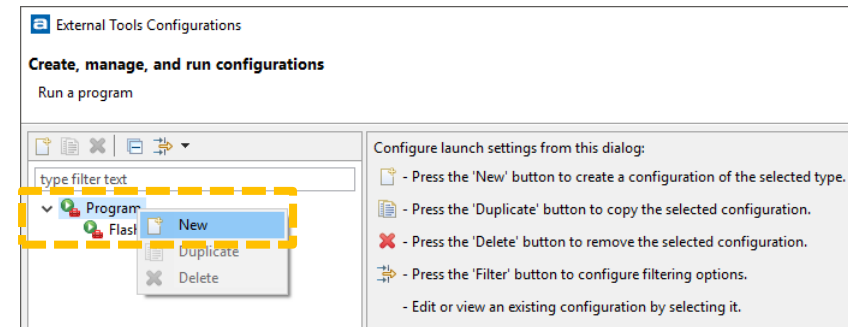

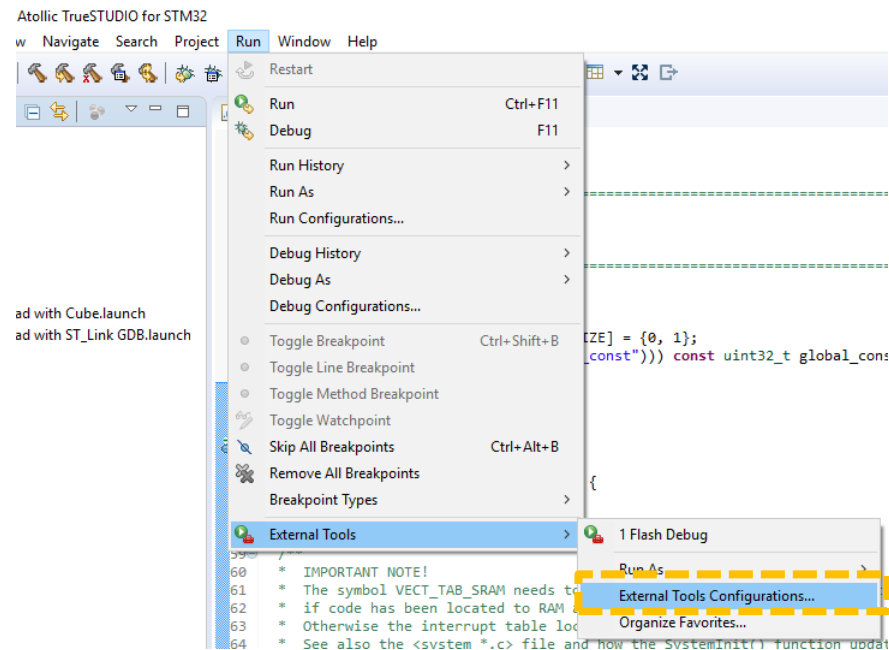

4. Open *Startup Scripts* tab
5. Remove or comment the load command

Create an ext. tools config...

Run → External Tools → External Tools Configurations...

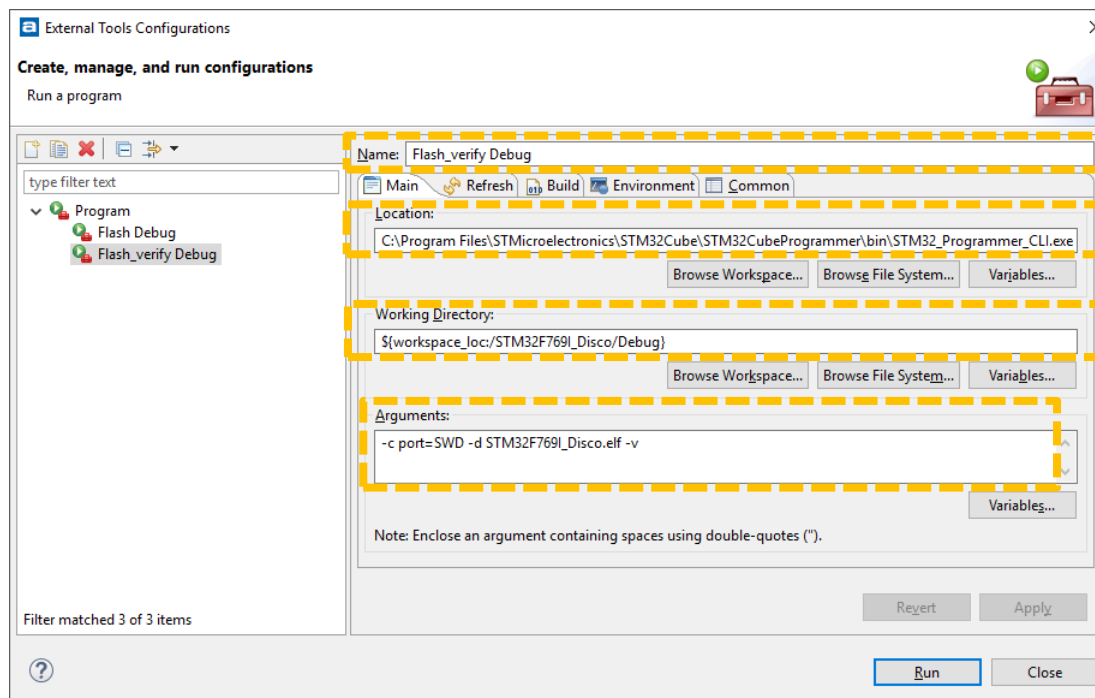

Ext. tools config for STM32CubeProgrammer

Name: Give the configuration a name describes what it does

Location: Should point to the STM32CubeProgrammer CLI executable

Working directory: Can be set to project output folder for the relevant build configuration

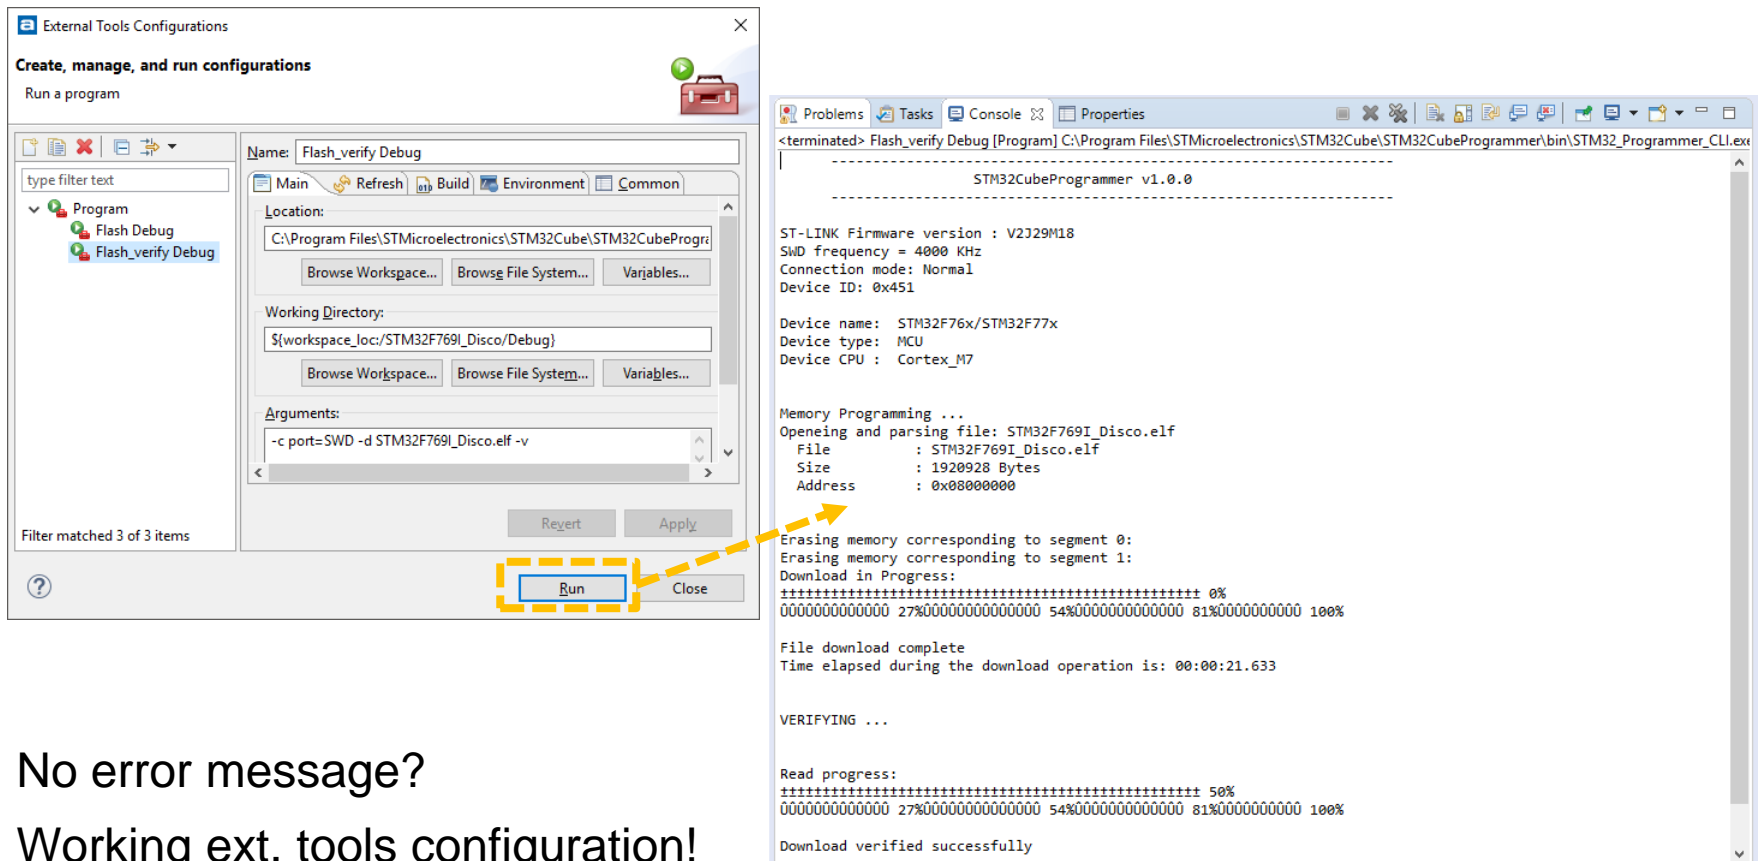

Arguments: STM32CubeProgrammer will be called with these arguments/options

When this step is done you can call STM32CubeProgrammer from within the IDE!

Test launch of STM32CubeProgrammer

Verify that your ext. tools configuration works as expected by running it!

The image shows two screenshots from an IDE. The left screenshot is the 'External Tools Configurations' dialog box. It is titled 'External Tools Configurations' and has a subtitle 'Create, manage, and run configurations'. Below the subtitle is the text 'Run a program'. On the left side, there is a tree view with a search filter 'type filter text'. Under the 'Program' category, there are three items: 'Flash Debug', 'Flash_verify Debug', and 'Flash_verify Debug'. The 'Flash_verify Debug' item is selected. The main area of the dialog shows the configuration for 'Flash_verify Debug'. It has tabs for 'Main', 'Refresh', 'Build', 'Environment', and 'Common'. The 'Main' tab is active. The 'Location' field contains 'C:\Program Files\STMicroelectronics\STM32Cube\STM32CubeProgrammer\bin\STM32_Programmer_CLI.exe'. Below it are buttons for 'Browse Workspace...', 'Browse File System...', and 'Variables...'. The 'Working Directory' field contains '{workspace_loc:/STM32F769I_Disco/Debug}'. Below it are buttons for 'Browse Workspace...', 'Browse File System...', and 'Variables...'. The 'Arguments' field contains '-c port=SWD -d STM32F769I_Disco.elf -v'. At the bottom right of the dialog, there are 'Revert' and 'Apply' buttons, and a 'Run' button which is highlighted with a dashed yellow box. An orange arrow points from the 'Run' button to the console output on the right.

The right screenshot is the IDE's console window. It shows the output of the 'Flash_verify Debug' program. The output starts with '<terminated> Flash_verify Debug [Program] C:\Program Files\STMicroelectronics\STM32Cube\STM32CubeProgrammer\bin\STM32_Programmer_CLI.exe'. Below this, there is a dashed line and the text 'STM32CubeProgrammer v1.0.0'. The output continues with 'ST-LINK Firmware version : V2J29M18', 'SWD frequency = 4000 KHz', 'Connection mode: Normal', and 'Device ID: 0x451'. This is followed by 'Device name: STM32F76x/STM32F77x', 'Device type: MCU', and 'Device CPU : Cortex_M7'. The next section is 'Memory Programming ...', which includes 'Opening and parsing file: STM32F769I_Disco.elf', 'File : STM32F769I_Disco.elf', 'Size : 1920928 Bytes', and 'Address : 0x08000000'. This is followed by 'Erasing memory corresponding to segment 0:', 'Erasing memory corresponding to segment 1:', and 'Download in Progress:'. The download progress is shown as a series of asterisks and percentages: '0%', '27%', '54%', '81%', and '100%'. Below this, it says 'File download complete' and 'Time elapsed during the download operation is: 00:00:21.633'. The next section is 'VERIFYING ...'. This is followed by 'Read progress:' and another series of asterisks and percentages: '50%', '27%', '54%', '81%', and '100%'. The final line of output is 'Download verified successfully'.

No error message?

Working ext. tools configuration!

Create a Launch Group...

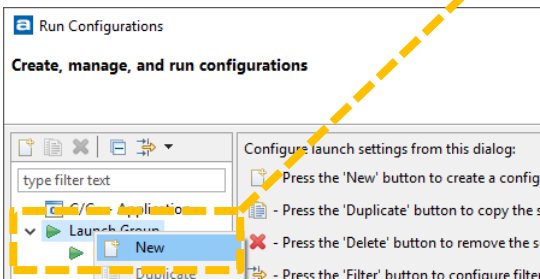

Create a launch group run configuration that will perform;

1. flash with *ext. tool*,
2. launch *debug configuration*:

Run → *Run Configurations...*

Right-click *Launch Group* → *New*

Add flash step into Launch Group

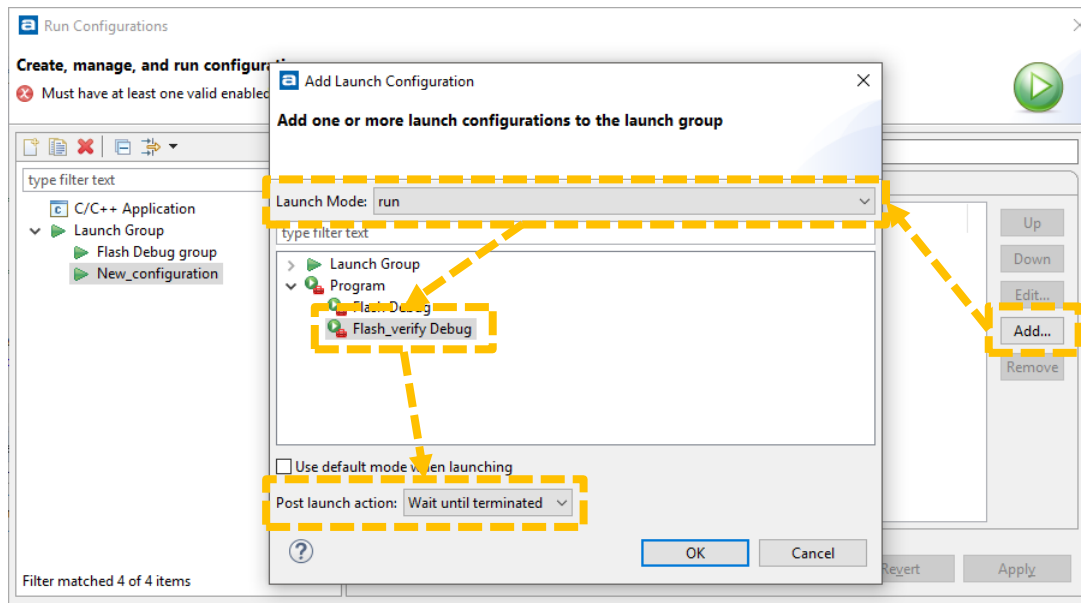

Add STM32CubeProgrammer ext. tool configuration as first step in the launch group:

Run Configurations → *Add...*

Launch mode: **run**

Program: The ext.tool configured on page 9-10

Post launch action: **Wait until terminated** ← **IMPORTANT!**

Add debug configuration into Launch Group

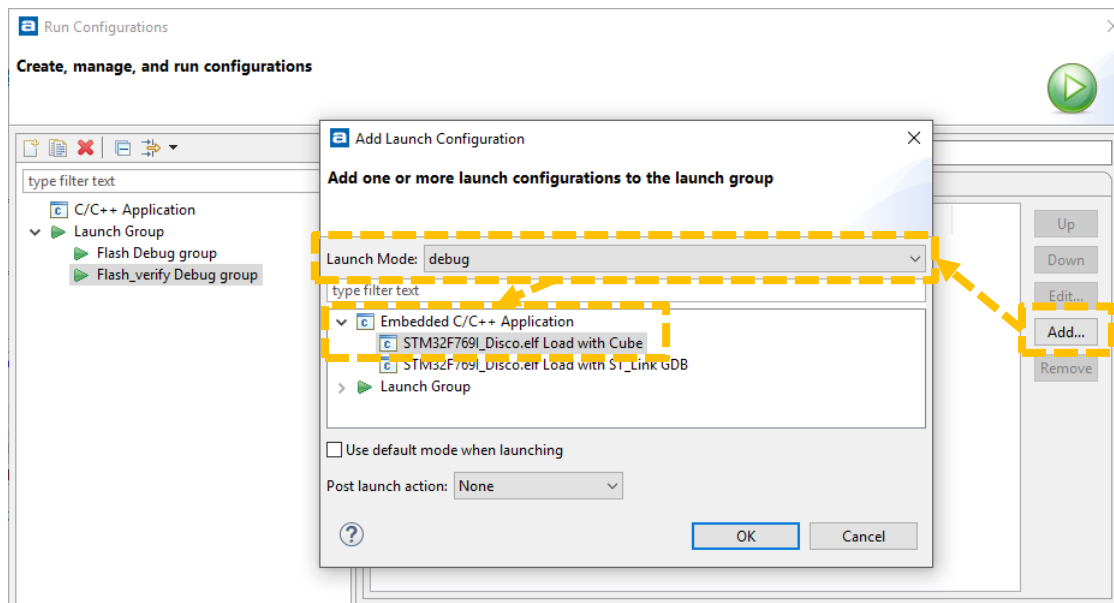

Add a *debug configuration* to the *Launch Group* after STM32CubeProgrammer has finished flash operation:

Run Configurations → *Add...*

Launch mode: **debug**

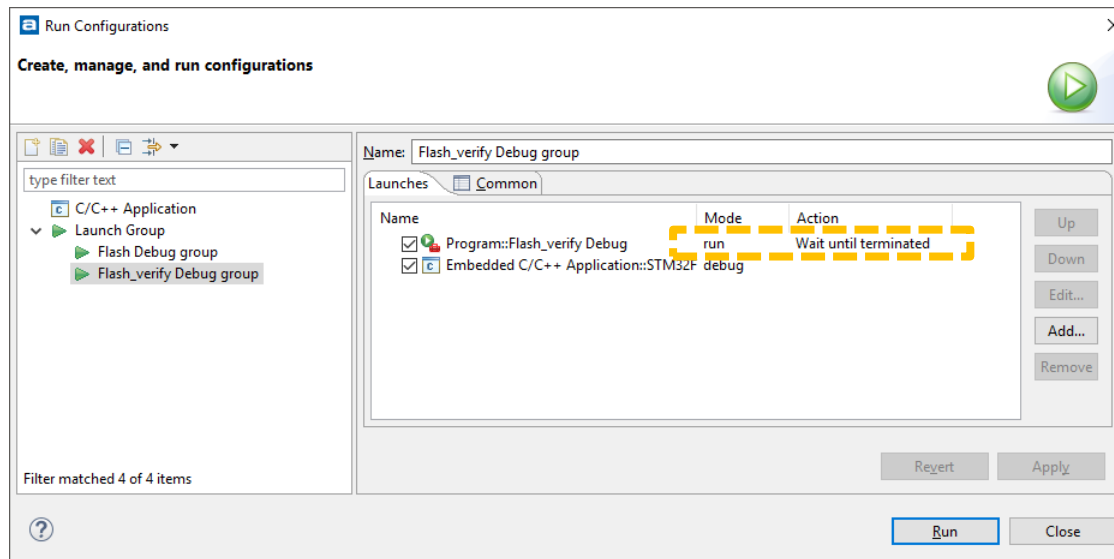

Embedded C Application: The debug configuration used in TrueSTUDIO to debug the project

Post launch action: **none**

How-to integrate STM32CubeProgrammer?

The complete *Launch Group* should look like this:

Click *Run* to test that:

1. The Launch Group runs STM32CubeProgrammer to flash the device
2. The Launch Group launches the debug configuration to debug the device

Done!

We are always interested to hear your feedback!
